 - All Air-conditioning service in catering, mobile homes, vans
 - All appliances of market leading manufacturers such as Daikin, Fujitsu, Toshiba, Mitsubishi, Panasonic, LG, Samsung, Sharp etc
-
- All emergencies

Getting to know how air-conditioning system works

Air conditioners and refrigerators work the same way. Instead of cooling just the small, insulated space inside of a refrigerator, an air conditioner cools a room, a whole house, or an entire business premises. When the temperature outside begins to rise, many people look for the cool comfort of indoor air conditioning so that they can do things comfortably as when it gets too hot you could lose your concentration.

Air conditioners use chemicals that easily convert from a gas to a liquid and back again. This chemical is used to transfer heat from the air inside of a home to the outside air.

The machine has three main parts. They are a compressor, a condenser and an evaporator. The compressor and condenser are usually located on the outside air portion of the air conditioner. The evaporator is located on the inside the house, sometimes as part of a furnace. That's the part that heats your house
