**Commercial Kitchen Canopies, Ventilation Systems Repair and Installation Engineer  
(Family Run Trusted)**

A kitchen ventilation system incorporating extract and supply air is no longer an optional extra but a legal requirement.

There are a number of means of ventilating the Kitchen

### **Kitchen Extraction Canopies**

Extraction canopies are one of the key pieces of apparatus when it comes to tackling kitchen ventilation. The prime function of a kitchen canopy is to protect the area surrounding the kitchen appliances from soiled matter heat and flame. The air flow is designed to capture the fumes and cooking by-products and, by means of filters within the canopy to discharge cleaner air to atmosphere.

### **Condense Canopies**

Condense canopies are mainly installed over equipment that produces steam i.e. pass through

dishwashers and sterilising sinks. The basic principle is the same as an extraction canopy but with baffle plates and a drain off point for the condensation. Condense canopies, filter plenums and ducted systems can be altered and extended on site to incorporate changes that are made to the catering equipment layout

## **Ventilated Ceiling**

Ventilated ceiling are increasingly popular as aesthetics become more important within commercial kitchens, because they provide a clean line of sight, whilst providing a comfortable and safe working environment. Ventilated Ceiling System is recommended for light to medium type cooking. Ideal for prestige architectural projects, display/exhibit cooking, culinary schools, correctional facilities and cook-chill operations.

There are now many levels of filtration and odour control that can be fitted and these can be tailored to suit the budget, local authority requirements and location of the site.

The ventilation system can be fully integrated with the building management system complete with tempered and chilled supply air to provide a comfortable working kitchen environment. Under the latest Gas Regulations, BS6173, the supply to the kitchen must be fitted with a gas safety interlock. This ensures by monitoring the supply and extract air flows that in the event of a ventilation failure the kitchen does not fill with contaminated air and remains properly ventilated.

**The standard gas interlock system comprises of:**

- An alarm control panel with visual indicators and an audible alarm
- Current monitors or airflow switches (supply and extract)
- Emergency stop button(s)
- Gas solenoid valve
